

AMC1311x-Q1 High-Impedance, 2-V Input, Reinforced Isolated Amplifiers

1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
 - Device Temperature Grade 1: -40°C to 125°C Ambient Operating Temperature Range
 - Device HBM ESD Classification Level 2
 - Device CDM ESD Classification Level C6
- 2-V, High-Impedance Input Voltage Range Optimized for Isolated Voltage Measurement
- Low Offset Error and Drift:
 - AMC1311B-Q1: $\pm 1.5\text{ mV}$ (max), $\pm 15\text{ }\mu\text{V}/^{\circ}\text{C}$ (max)
 - AMC1311-Q1: $\pm 9.9\text{ mV}$ (max), $\pm 20\text{ }\mu\text{V}/^{\circ}\text{C}$ (typ)
- Fixed Gain: 1
- Very Low Gain Error and Drift:
 - AMC1311B-Q1: $\pm 0.3\%$ (max), $\pm 45\text{ ppm}/^{\circ}\text{C}$ (max)
 - AMC1311-Q1: $\pm 1\%$ (max), $\pm 30\text{ ppm}/^{\circ}\text{C}$ (typ)
- Low Nonlinearity and Drift: 0.01%, 1 ppm/ $^{\circ}\text{C}$ (typ)
- 3.3-V Operation on High-Side (AMC1311B-Q1)
- Missing High-Side Supply Indication
- Safety-Related Certifications:
 - 7000- V_{PK} Reinforced Isolation per DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01
 - 5000- V_{RMS} Isolation for 1 Minute per UL1577
 - CAN/CSA No. 5A-Component Acceptance Service Notice

2 Applications

- Isolated Voltage Sensing In:
 - Traction Inverters
 - Onboard Chargers
 - DC/DC Converters

3 Description

The AMC1311-Q1 is a precision, isolated amplifier with an output separated from the input circuitry by an isolation barrier that is highly resistant to magnetic interference. This barrier is certified to provide reinforced galvanic isolation of up to 7 kV_{PEAK} according to VDE V 0884-11 and UL1577. Used in conjunction with isolated power supplies, this isolated amplifier separates parts of the system that operate on different common-mode voltage levels and protects lower-voltage parts from damage.

The high-impedance input of the AMC1311-Q1 is optimized for connection to high-voltage resistive dividers or other voltage signal sources with high output resistance. The excellent performance of the device supports accurate, low temperature drift voltage or temperature sensing and control in closed-loop systems. The integrated missing high-side supply voltage detection feature simplifies system-level design and diagnostics.

The AMC1311-Q1 is offered with two performance grade options: AMC1311-Q1 and AMC1311B-Q1.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
AMC1311x-Q1	SOIC (8)	5.85 mm x 7.50 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

5 Device Comparison Table

PARAMETER		AMC1311B-Q1	AMC1311-Q1
High-side supply voltage, VDD1		3.0 V to 5.5 V	4.5 V to 5.5 V
Specified ambient temperature, T _A		–40°C to +125°C	–40°C to +125°C
Input offset voltage, V _{OS}	4.5 V ≤ VDD1 ≤ 5.5 V	±1.5 mV	±9.9 mV
	3.0 V ≤ VDD1 ≤ 5.5 V	±2.5 mV	Not applicable
Input offset drift, TCV _{OS}		±3 μV/°C (typ), ±15 μV/°C (max)	±20 μV/°C (typ)
Gain error, E _G		±0.3%	±1%
Gain error drift, TCE _G		±5 ppm/°C (typ), ±45 ppm/°C (max)	±30 ppm/°C (typ)
Common-mode transient immunity, CMTI		75 kV/μs (min)	15 kV/μs (min)

6 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NO.	NAME		
1	VDD1	—	High-side power supply, 3.0 V to 5.5 V for the AMC1311B-Q1 (4.5 V to 5.5 V for the AMC1311-Q1), relative to GND1. See the Power Supply Recommendations section for power-supply decoupling recommendations.
2	VIN	I	Analog input
3	SHTDN	I	Shutdown input, active high, with internal pullup resistor (typical value: 100 kΩ)
4	GND1	—	High-side analog ground
5	GND2	—	Low-side analog ground
6	VOUTN	O	Inverting analog output
7	VOUTP	O	Noninverting analog output
8	VDD2	—	Low-side power supply, 3.0 V to 5.5 V, relative to GND2. See the Power Supply Recommendations section for power-supply decoupling recommendations.

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾

		MIN	MAX	UNIT
Power-supply voltage	VDD1 to GND1	−0.3	6.5	V
	VDD2 to GND2	−0.3	6.5	
Input voltage	VIN	GND1 − 6	VDD1 + 0.5	V
	SHTDN	GND1 − 0.5	VDD1 + 0.5	
Output voltage	VOU _{TP} , VOU _{TN}	GND2 − 0.5	VDD2 + 0.5	V
Input current	Continuous, any pin except power-supply pins	−10	10	mA
Temperature	Junction, T _J		150	°C
	Storage, T _{stg}	−65	150	

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per AEC Q100-011	±1000	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
POWER SUPPLY					
High-side power supply	VDD1 to GND1, AMC1311-Q1	4.5	5	5.5	V
	VDD1 to GND1, AMC1311B-Q1	3.0	5	5.5	
Low-side power supply	VDD2 to GND2	3.0	3.3	5.5	V
ANALOG INPUT					
Absolute input voltage	VIN to GND1	−2		VDD1	V
V _{FSR} Specified linear input full-scale voltage	VIN to GND1	−0.1		2	V
V _{Clipping} Input voltage before clipping output	VIN to GND1		2.516		V
DIGITAL INPUT					
Input voltage	SHTDN	GND1		VDD1	V
TEMPERATURE RANGE					
T _A Specified ambient temperature		−40		125	°C

7.4 Thermal Information

THERMAL METRIC ⁽¹⁾		AMC1311x-Q1	UNIT
		DWV (SOIC)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	84.6	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	28.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	41.1	°C/W
ψ_{JT}	Junction-to-top characterization parameter	4.9	°C/W
ψ_{JB}	Junction-to-board characterization parameter	39.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

7.5 Power Ratings

PARAMETER		TEST CONDITIONS	VALUE	UNIT
P_D	Maximum power dissipation (both sides)	VDD1 = VDD2 = 5.5 V	97.9	mW
		VDD1 = VDD2 = 3.6 V, AMC1311B-Q1 only	56.16	
P_{D1}	Maximum power dissipation (high-side supply)	VDD1 = 5.5 V	53.35	mW
		VDD1 = 3.6 V, AMC1311B-Q1 only	30.24	
P_{D2}	Maximum power dissipation (low-side supply)	VDD2 = 5.5 V	44.55	mW
		VDD2 = 3.6 V	25.92	

7.6 Insulation Specifications

over operating ambient temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	VALUE	UNIT
GENERAL				
CLR	External clearance ⁽¹⁾	Shortest pin-to-pin distance through air	≥ 9	mm
CPG	External creepage ⁽¹⁾	Shortest pin-to-pin distance across the package surface	≥ 9	mm
DTI	Distance through insulation	Minimum internal gap (internal clearance) of the double insulation (2 × 0.0105 mm)	≥ 0.021	mm
CTI	Comparative tracking index	DIN EN 60112 (VDE 0303-11); IEC 60112	≥ 600	V
	Material group	According to IEC 60664-1	I	
	Overvoltage category per IEC 60664-1	Rated mains voltage ≤ 300 V _{RMS}	I-IV	
		Rated mains voltage ≤ 600 V _{RMS}	I-IV	
		Rated mains voltage ≤ 1000 V _{RMS}	I-III	
DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01 ⁽²⁾				
V _{IORM}	Maximum repetitive peak isolation voltage	At ac voltage (bipolar)	2121	V _{PK}
V _{IOWM}	Maximum-rated isolation working voltage	At ac voltage (sine wave)	1500	V _{RMS}
		At dc voltage	2121	V _{DC}
V _{IOTM}	Maximum transient isolation voltage	V _{TEST} = V _{IOTM} , t = 60 s (qualification test)	7000	V _{PK}
		V _{TEST} = 1.2 × V _{IOTM} , t = 1 s (100% production test)	8400	
V _{IOSM}	Maximum surge isolation voltage ⁽³⁾	Test method per IEC 60065, 1.2/50-μs waveform, V _{TEST} = 1.6 × V _{IOSM} = 12800 V _{PK} (qualification)	8000	V _{PK}
q _{pd}	Apparent charge ⁽⁴⁾	Method a, after input/output safety test subgroup 2 / 3, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.2 × V _{IORM} = 2545 V _{PK} , t _m = 10 s	≤ 5	pC
		Method a, after environmental tests subgroup 1, V _{ini} = V _{IOTM} , t _{ini} = 60 s, V _{pd(m)} = 1.6 × V _{IORM} = 3394 V _{PK} , t _m = 10 s	≤ 5	
		Method b1, at routine test (100% production) and preconditioning (type test), V _{ini} = V _{IOTM} , t _{ini} = 1 s, V _{pd(m)} = 1.875 × V _{IORM} = 3977 V _{PK} , t _m = 1 s	≤ 5	
C _{IO}	Barrier capacitance, input to output ⁽⁵⁾	V _{IO} = 0.5 V _{PP} at 1 MHz	~1	pF
R _{IO}	Insulation resistance, input to output ⁽⁵⁾	V _{IO} = 500 V at T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500 V at 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500 V at T _S = 150°C	> 10 ⁹	
	Pollution degree		2	
	Climatic category		55/125/21	
UL1577				
V _{ISO}	Withstand isolation voltage	V _{TEST} = V _{ISO} = 5000 V _{RMS} or 7000 V _{DC} , t = 60 s (qualification), V _{TEST} = 1.2 × V _{ISO} = 6000 V _{RMS} , t = 1 s (100% production test)	5000	V _{RMS}

- (1) Apply creepage and clearance requirements according to the specific equipment isolation standards of an application. Care must be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed circuit board (PCB) do not reduce this distance. Creepage and clearance on a PCB become equal in certain cases. Techniques such as inserting grooves and ribs on the PCB are used to help increase these specifications.
- (2) This coupler is suitable for *safe electrical insulation* only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Testing is carried out in air or oil to determine the intrinsic surge immunity of the isolation barrier.
- (4) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (5) All pins on each side of the barrier are tied together, creating a two-pin device.

7.7 Safety-Related Certifications

VDE	UL
Certified according to DIN V VDE V 0884-11 (VDE V 0884-11): 2017-01, DIN EN 60950-1 (VDE 0805 Teil 1): 2014-08, and DIN EN 60065 (VDE 0860): 2005-11	Recognized under 1577 component recognition and CSA component acceptance NO 5 programs
Reinforced insulation	Single protection
Certificate number: 40040142	File number: E181974

7.8 Safety Limiting Values

Safety limiting intends to minimize potential damage to the isolation barrier upon failure of input or output (I/O) circuitry. A failure of the I/O may allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _S Safety input, output, or supply current	R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C, VDD1 = VDD2 = 5.5 V, see Figure 2			268	mA
	R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C, VDD1 = VDD2 = 3.6 V, AMC1311B-Q1 only, see Figure 2			410	
P _S Safety input, output, or total power ⁽¹⁾	R _{θJA} = 84.6°C/W, T _J = 150°C, T _A = 25°C, see Figure 3			1477	mW
T _S Maximum safety temperature				150	°C

(1) Input, output, or the sum of input and output power must not exceed this value.

The maximum safety temperature is the maximum junction temperature specified for the device. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

AMC1311-Q1

8 Detailed Description

8.1 Overview

The AMC1311-Q1 is a precision, isolated amplifier with a high input-impedance and wide input-voltage range. The input stage of the device drives a second-order, delta-sigma ($\Delta\Sigma$) modulator. The modulator uses the internal voltage reference and clock generator to convert the analog input signal to a digital bitstream. The drivers (termed TX in the [Functional Block Diagram](#) section) transfer the output of the modulator across the isolation barrier that separates the high-side and low-side voltage domains. The received bitstream and clock are synchronized and processed by a fourth-order analog filter on the low-side and presented as a differential analog output.

The SiO₂-based, double-capacitive isolation barrier supports a high level of magnetic field immunity, as described in [ISO72x Digital Isolator Magnetic-Field Immunity](#). The digital modulation used in the AMC1311-Q1 and the isolation barrier characteristics result in high reliability and common-mode transient immunity.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Analog Input

The input stage of the AMC1311-Q1 feeds a second-order, switched-capacitor, feed-forward $\Delta\Sigma$ modulator. The modulator converts the analog signal into a bitstream that is transferred over the isolation barrier, as described in the [Isolation Channel Signal Transmission](#) section. The high-impedance, and low bias-current input of the AMC1311-Q1 makes the device suitable for isolated voltage sensing applications. [Figure 45](#) depicts the equivalent input structure of the AMC1311-Q1 with the relevant components.

Figure 45. Equivalent Analog Input Circuit

Feature Description (continued)

There are two restrictions on the analog input signal, VIN. First, if the input voltage VIN exceeds the voltage of 6.5 V, the input current must be limited to 10 mA because the device input electrostatic discharge (ESD) protection turns on. In addition, the linearity and noise performance of the device are ensured only when the analog input voltage remains within the specified linear full-scale range (VFSR).

8.3.2 Isolation Channel Signal Transmission

The AMC1311-Q1 uses an on-off keying (OOK) modulation scheme to transmit the modulator output bitstream across the SiO₂-based isolation barrier. As shown in Figure 46, the transmitter modulates the bitstream at TX IN with an internally-generated, high-frequency carrier across the isolation barrier to represent a digital *one* and does not send a signal to represent the digital *zero*. The nominal frequency of the carrier used inside the AMC1311-Q1 is 480 MHz.

The receiver demodulates the signal after advanced signal conditioning and produces the output. The AMC1311-Q1 also incorporates advanced circuit techniques to maximize the CMTI performance and minimize the radiated emissions caused by the high-frequency carrier and IO buffer switching.

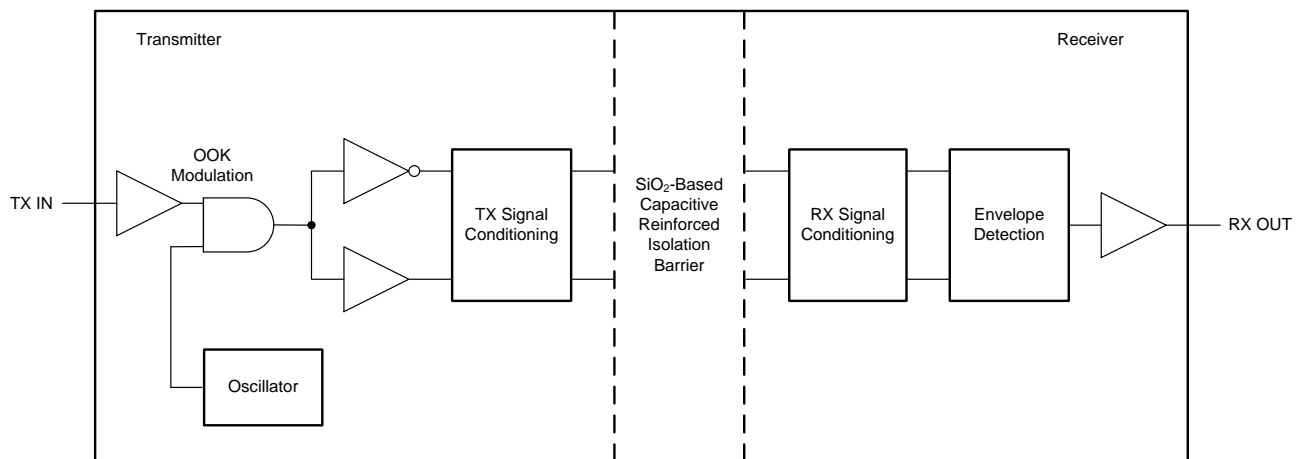

Figure 46. Block Diagram of an Isolation Channel

Figure 47 shows the concept of the OOK scheme.

Figure 47. OOK-Based Modulation Scheme

Feature Description (continued)

8.3.3 Fail-Safe Output

The AMC1311-Q1 offers a fail-safe output that simplifies diagnostics on system level. The fail-safe output is active in three cases:

- When the high-side supply VDD1 of the AMC1311-Q1 device is missing
- When the high-side supply VDD1 falls under the $V_{DD1_{UV}}$ undervoltage threshold level or
- When the SHTDN pin is pulled high

Figure 48 shows the fail-safe output of the AMC1311-Q1 that is a negative differential output voltage that does not occur under normal device operation. As a reference value for the fail-safe detection on a system level, use the $V_{FAILSAFE}$ voltage as specified in the [Electrical Characteristics](#) table.

Figure 48. AMC1311-Q1 Output Behavior

8.4 Device Functional Modes

The AMC1311-Q1 is operational when the power supplies VDD1 and VDD2 are applied, as specified in the [Recommended Operating Conditions](#) table.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The very low input bias current, ac and dc errors, and temperature drift make the AMC1311-Q1 a high-performance solution for automotive applications where voltage measurement with high common-mode levels is required.

9.2 Typical Application

Isolated amplifiers are widely used in automotive applications such as traction inverters, on-board chargers, and dc/dc converters. The input structure of the AMC1311-Q1 is tailored for isolated voltage sensing using resistive dividers to reduce the high common-mode voltage.

Figure 49 depicts a typical use of the AMC1311-Q1 for dc bus voltage sensing in a traction inverter application. Phase current measurement is accomplished through the shunt resistors, R_{SHUNT} (in this case, two-pin shunts) and the [AMC1301-Q1](#) isolated amplifiers that are optimized for isolated current sensing. The high-impedance input and the high common-mode transient immunity of the AMC1311-Q1 ensure reliable and accurate operation even in high-noise environments.

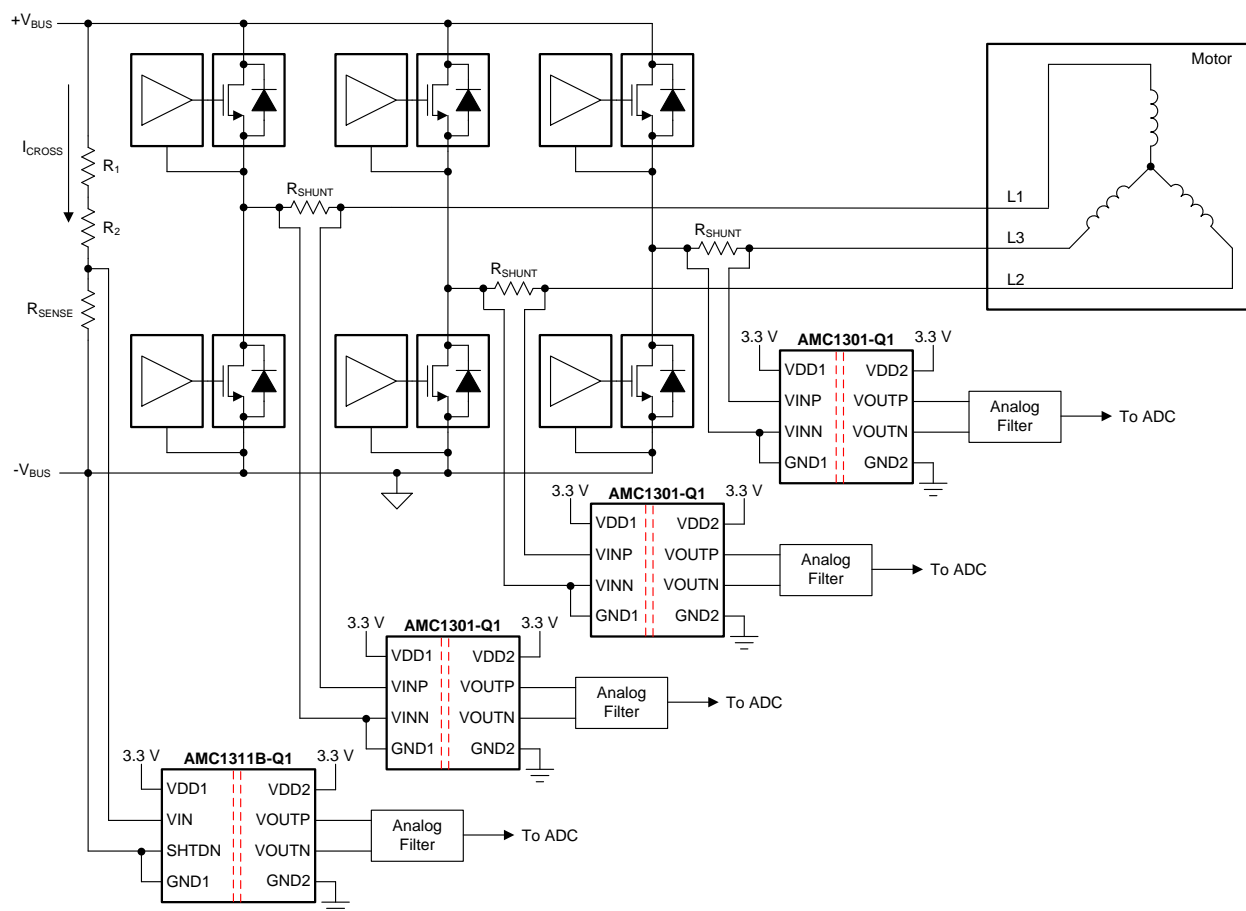

Figure 49. Using the AMC1311B-Q1 for DC Bus Voltage Sensing in Traction Inverters

Typical Application (continued)

9.2.1 Design Requirements

Table 1 lists the parameters for this typical application.

Table 1. Design Requirements

PARAMETER	VALUE
High-side supply voltage	3.3 V or 5 V
Low-side supply voltage	3.3 V or 5 V
Voltage drop across the sensing resistor for a linear response	2 V (maximum)
Current through the resistive divider, I_{CROSS}	0.1 mA (maximum)
Signal delay (50% V_{IN} to 90% V_{OUTP} , V_{OUTN})	3 μ s (maximum)

9.2.2 Detailed Design Procedure

Use Ohm's Law to calculate the minimum total resistance of the resistive divider to limit the cross current to the desired value ($R_{TOTAL} = V_{BUS} / I_{CROSS}$) and the required sense resistor value to be connected to the AMC1311-Q1 input: $R_{SENSE} = V_{FSR} / I_{CROSS}$.

Consider the following two restrictions to choose the proper value of the shunt resistor R_{SENSE} :

- The voltage drop on R_{SENSE} caused by the nominal voltage range of the system must not exceed the recommended input voltage range: $V_{SENSE} \leq V_{FSR}$
- The voltage drop on R_{SENSE} caused by the maximum allowed system overvoltage must not exceed the input voltage that causes a clipping output: $V_{SENSE} \leq V_{Clipping}$

Table 2 lists examples of nominal E96-series (1% accuracy) resistor values for systems using 600 V and 800 V on the dc bus.

Table 2. Resistor Value Examples

PARAMETER	600-V DC BUS	800-V DC Bus
Resistive divider resistor R_1	3.01 M Ω	4.22 M Ω
Resistive divider resistor R_2	3.01 M Ω	4.22 M Ω
Sense resistor R_{SENSE}	20 k Ω	21 k Ω
Resulting current through resistive divider I_{CROSS}	99.3 μ A	94.5 μ A
Resulting voltage drop on sense resistor V_{SENSE}	1.987 V	1.986 V

For systems using single-ended input ADCs, Figure 50 shows an example of a TLV313-Q1-based signal conversion and filter circuit as used on the AMC1311EVM. Tailor the bandwidth of this filter stage to the bandwidth requirement of the system and use NP0-type capacitors for best performance.

Figure 50. Connecting the AMC1311-Q1 Output to Single-Ended Input ADC

For more information on the general procedure to design the filtering and driving stages of SAR ADCs, see [18-Bit, 1MSPS Data Acquisition Block \(DAQ\) Optimized for Lowest Distortion and Noise](#) and [18-Bit Data Acquisition Block \(DAQ\) Optimized for Lowest Power](#), available for download at www.ti.com.

9.2.3 Application Curve

In traction inverter applications, the power switches must be protected in case of an overvoltage condition. To allow for fast system power-off, a low delay caused by the isolated amplifier is required. Figure 51 shows the typical full-scale step response of the AMC1311-Q1. Consider the delay of the required window comparator and the MCU to calculate the overall response time of the system.

Figure 51. Step Response of the AMC1311B-Q1

9.3 Do's and Don'ts

Do not leave the analog input VIN of the AMC1311-Q1 unconnected (floating) when the device is powered up on the high-side. If the device input is left floating, the bias current may generate a negative input voltage that exceeds the specified input voltage range and the output of the device is invalid.

10 Power Supply Recommendations

In a typical traction inverter application, the high-side power supply (VDD1) for the AMC1311-Q1 is generated from the low-side supply (VDD2) of the device by an isolated dc/dc converter circuit. A low-cost solution is based on the push-pull driver [SN6501-Q1](#) and a transformer that supports the desired isolation voltage ratings. TI recommends using a low-ESR decoupling capacitor of 0.1 μF and an additional capacitor of minimum 1 μF for both supplies of the AMC1311-Q1. Place these decoupling capacitors as close as possible to the AMC1311-Q1 power-supply pins to minimize supply current loops and electromagnetic emissions.

The AMC1311-Q1 does not require any specific power up sequencing. Consider the analog settling time t_{AS} as specified in the [Switching Characteristics](#) table after ramp up of the VDD1 high-side supply.

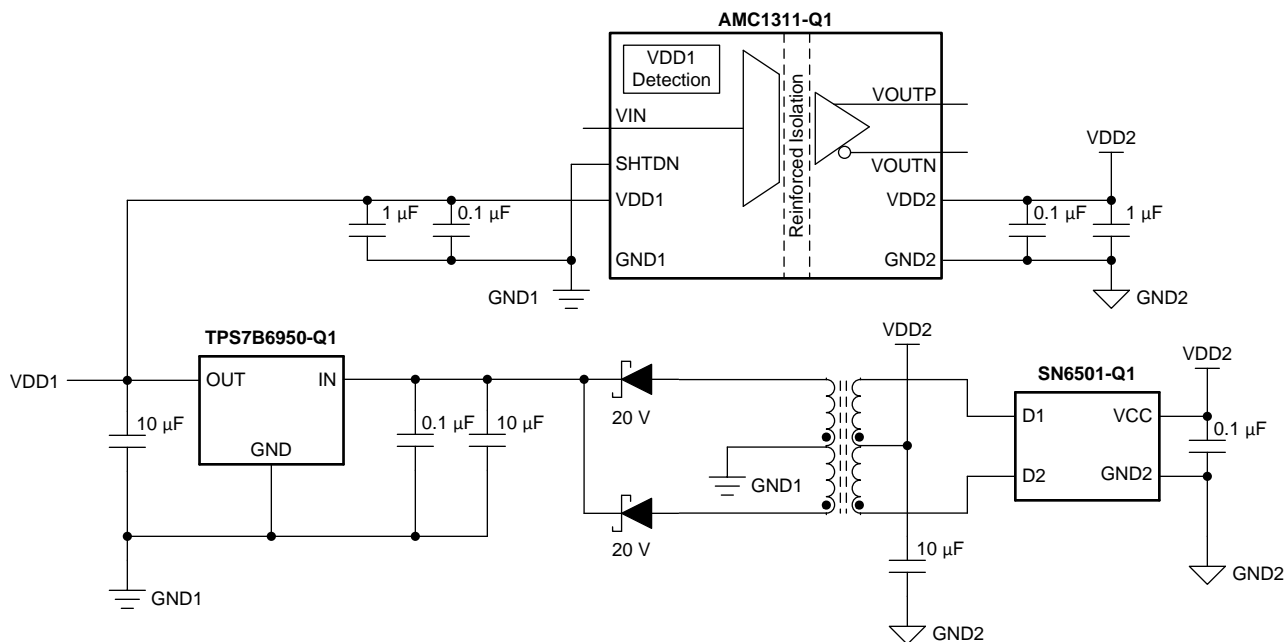

Figure 52. SN6501-Q1-Based, High-Side Power Supply

11 Layout

11.1 Layout Guidelines

For best performance, place the smaller 0.1- μ F decoupling capacitors (C1 and C6) as close as possible to the AMC1311-Q1 power-supply pins, followed by the additional C2 and C5 capacitors with a minimum value of 1 μ F. The resistors and capacitors used for the analog input (C3) and output filters (R5, R10, and C13) are placed next to the decoupling capacitors. Use 1206-size, SMD-type, ceramic decoupling capacitors and route the traces to the VIN and SHTDN pins underneath. Connect the supply voltage sources in a way that allows the supply current to flow through the pads of the decoupling capacitors before powering the AMC1311-Q1.

Figure 53 shows this approach as implemented on the [AMC1311EVM](#). Capacitors C5 and C6 decouple the high-side supply VDD1 while capacitors C1 and C2 are used to support the low-side supply VDD2 of the AMC1311-Q1.

12.4 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
